

QS ERP Workflow

How an import moves through our company — from the order to the goods in our warehouse. One application (PO / INV no.) follows every step.

THE APPLICATION · one PO / INV no. follows the whole journey

It opens with the order and stays open until every container is in the warehouse, the PD is written off and the supplier is fully paid

Application status keeps:

PO / INV no. Supplier INV amount + qty Payment terms Bank + funding (deposit / loan) PD no. + expiry PD status Applied / Paid (SWIFT) / Remaining B/L no. Containers: X of Y received
POD + ETA per container Inbounded qty Warehouse

Always visible:

Current stage Stopped? YES / NO Stop reason code Owner Stopped since + days Next action + expected date

APPLICATION STATUS

current stage · records every update

- Order confirmed**
Pending order / PI received
- Invoiced + funded**
Terms set · deposit / loan

Outbound / sales

Sales invoice, customer

APPLICATION STATUS RECORDS EVERYTHING

Every update from every lane is saved on the application — date, what changed, who did it — and it keeps tracking where it is stopped and why.

Example of one application's history

12 Sep	Order	Purchase invoice entered — 5,040 pcs	Purchasing	06 Oct	Stop	STOPPED: BANK — SWIFT over limit, calling bank	Accountant
15 Sep	PD	PD submitted in ASYCUDA	Customs	09 Oct	Payment	SWIFT confirmed — deposit paid	Accountant
18 Sep	Bank	Loan received from bank, commission recorded	Accountant	28 Oct	Shipment	B/L issued — 5 containers listed	Logistics
20 Sep	Payment	Payment application sent to bank	Accountant	30 Nov	Warehouse	3 of 5 containers received	Warehouse

WHERE IS IT STOPPED — AND WHY? Any problem that appears in tracking must be updated in the application status.

Any stage over its time limit must carry a reason code, owner and next action. Time limits are set by you (example only: SWIFT 14 days). Every change is logged.

PD — not validated / expired FUND — waiting deposit or loan DOC — documents missing at bank BANK — bank internal approval CBI — platform / K2 compliance review REJ — rejected, resubmit SUP — supplier bank details / query
CORR — correspondent bank hold AMT — amount mismatch SHIP — container delayed at origin / port CUS — customs / port file pending OTHER — free text

Goods tracking ends: every container received in the warehouse

APPLICATION CLEARED — closed when all three are done

Supplier fully paid + Every container received (qty = invoice qty) + PD totally written off

The lanes run side by side — money, PD and goods move at their own speed, and every update in any lane is recorded in the application status. One invoice can have several B/Ls and many containers; each container is followed on its own. Dates, day limits and numbers shown (e.g. SWIFT 14 days, "3 of 5 containers", the example history) are examples only.
