

Contents

Document authority and execution rule

Issa Mohammed is the sole Business Process Owner and final authority for ERP functional design, accounting logic, workflows, document lifecycles, reporting structure and implementation priorities. The IT specialist shall implement the approved requirements, report technical constraints, perform technical testing and submit results. No business rule, accounting rule, workflow or permission rule may be changed without written approval from Issa Mohammed.

1 Executive Summary and Target Outcome

The ERP shall be a single integrated platform for the company's complete operational and financial lifecycle. It shall support one legal entity with multiple branches, formal departments, multiple warehouses, multiple bank accounts, independent cost centres and consolidated company reporting.

Governing authority

Issa Mohammed is the sole Business Process Owner. Department managers and employees provide operational information, but the final business process, accounting treatment, permissions, workflow, document lifecycle, reporting design and implementation priority are approved only by Issa Mohammed.

1.1 Target outcome

- One controlled source of truth for master data, source documents, approvals, operational movements, subledgers, journal entries and reports.
- Complete traceability from every posted accounting line to the originating document, branch, department, cost centre, business partner, item, warehouse, bank account, attachment and user action.
- No deletion of saved or posted records. Drafts may be cancelled and retained. Final documents may only be cancelled or corrected through an approved reversing document or full reversal journal.
- Automatic posting from approved operational documents according to the approved posting matrix and configurable account mappings.
- English-only user interface and documents.
- Operational currencies at launch: IQD and USD, with additional currencies configurable. IQD is the primary transaction and ledger currency; USD values are reporting equivalents calculated using approved historical exchange rates.

1.2 Mandatory architecture

Subledgers, control accounts and dimensions

The system shall maintain detailed customer, supplier, inventory, fixed-asset, bank, project and service subledgers that reconcile to the General Ledger. Branches, departments, cost centres, projects, warehouses and service lines shall be analytical dimensions. The Chart of Accounts shall remain hierarchical and configurable.

1.3 Required scope

The build includes Foundation and Security, Master Data, CRM, Sales, Purchasing, Inventory and Warehouses, Projects, Contracting, Logistics, Money Transfer, Investments, Core Financials, Accounts Payable, Accounts Receivable, Treasury, Fixed Assets, Budgeting, HR, Payroll, Employee Expenses and Advances, Document Management, Reporting, Integrations, Migration, Testing and Go-Live.

1.4 Accounting governance

Accounting recognition, measurement, presentation and disclosure shall follow applicable IFRS Accounting Standards. System configuration shall support controlled future updates when accounting standards or approved company policies change. Operational workflows and approval rules remain company-defined requirements.

2 Business Profile and Scope

2.1 Legal and organisational structure

- One legal company entity.

- Multiple branches under the same legal entity.
- Formal departments: Finance, Procurement, Sales, Warehouse, Projects, Contracting, Logistics, Money Transfer, Investments, HR and Management.
- No separate Legal Department in the current ERP structure.
- Multiple warehouses and bank accounts.
- Independent cost centres and department-level reporting.
- Consolidated reporting for the whole company.

2.2 Revenue streams

Revenue stream	ERP treatment
Product Sales	Sales Order, stock reservation, delivery, A/R Invoice, receipt, returns, warranty and gross-margin reporting.
Money Transfer	Client deposits, client clearing balance, transfer execution, bank charges, exchange spread, returned transfers and client statements.
Logistics	Separate service job, client billing, third-party costs, direct expenses and job margin. Logistics is separate from Money Transfer even when both relate to the same client import.
Projects and Contracting	Project master, budgets, costs, progress, billing, profitability and close.
Investments	Investment register, transactions, income, valuation, impairment and disposal.

2.3 Reporting currencies

Transactions and General Ledger balances are maintained primarily in IQD. USD reporting values are calculated from the historical exchange rate assigned to each transaction. Financial and management reports shall be available in IQD or USD without changing the original transaction currency or ledger amount.

2.4 Build boundary

The ERP blueprint defines the standard company-wide operating model. Module refinements identified during testing shall be introduced through controlled change requests after the base process works end to end and reconciles correctly.

3 Core Architecture and Integration Principles

3.1 One source of truth

- Each master record and transaction shall have one authoritative record and a unique system identifier.
- Downstream documents shall use Copy From or controlled conversion rather than re-entry.
- The system shall prevent duplicate posting through transaction identifiers and idempotency controls.

3.2 Standard document lifecycle

The common lifecycle is Draft, Submitted for Approval where required, Approved, Executed/Posted, Partially Completed, Completed/Closed, Cancelled or Reversed. Each document type shall use only the states applicable to its operational and accounting effect.

- A saved draft cannot be deleted; it may be edited or cancelled.
- A final operational or accounting document cannot be edited or deleted.
- A document with no accounting or inventory effect, such as an unexecuted Purchase Order, may be cancelled without a journal reversal.
- A posted document may be corrected only by the approved reversal or return document for that process.

3.3 Posting engine

- Operational documents shall create accounting entries automatically when their approved lifecycle event requires posting.
- All accounts used by automatic or manual journals shall exist and be active in the Chart of Accounts.
- Posting accounts shall be selected through configurable accounting mappings, not hard-coded account numbers.
- Every journal shall be balanced in IQD and retain source currency, historical rate and USD reporting equivalent.
- Each posting shall retain the source module, document and line identifiers for complete drill-down.

3.4 System-wide controls

- Server-side permission enforcement.
- Department and branch data scope.
- Complete immutable audit trail.
- Unique document numbering.
- Soft-close accounting periods.
- No negative inventory.
- Document attachment and related-record links.
- Controlled data import with validation and error reporting.

4 Organisation Structure, Dimensions and Master Data

4.1 Organisation hierarchy

Entity	Purpose	Key fields
Company / Legal Entity	Top-level accounting and reporting boundary	Legal name, registration, tax identifiers, base currency, fiscal calendar
Branch	Operational location or business branch	Code, name, address, manager, default warehouse, default cash account
Department	Responsibility and organisational reporting	Code, name, manager, parent department
Cost Centre	Expense and profitability analysis	Code, name, owner, budget responsibility
Business Line	Product Sales, Contracting, Projects, Logistics, Investments, Money Transfer	Code, revenue accounts, cost accounts, approval rules
Project	Temporary work and budget unit	Project code, customer, manager, dates, budget, status
Warehouse / Location / Bin	Physical stock control	Location, type, capacity, custody, transit flag

4.2 Analytical dimensions

The chart of accounts answers what type of financial activity occurred. Dimensions answer where, for whom, by whom and for which business purpose it occurred. Dimensions shall be mandatory or optional by account and document type.

Dimension	Typical use	Example validation
Branch	Branch-level profit and balance reporting	Mandatory for all operational transactions
Department / Cost Centre	Expense ownership and budgets	Mandatory for operating expense accounts
Business Line	Separate profitability for sales and each service line	Mandatory for revenue and direct cost accounts
Project	Project profitability and commitments	Mandatory for project-specific revenue, cost and inventory issues

Dimension	Typical use	Example validation
Warehouse	Inventory and fulfilment analysis	Mandatory for stock movements
Customer / Supplier	Subledger and profitability analysis	Derived from source document; not manually altered after posting
Employee / Salesperson	Commission, accountability and performance	Mandatory on selected CRM, sales and expense documents

4.3 Master data catalogue

Master	Data owner	Minimum content
Chart of Accounts	Finance	Account code/name, parent, type, posting allowed, control account flag, currency restrictions, required dimensions
Currency and Rates	Treasury/Finance	ISO code, decimals, accounting rate, market rate, client rate type, effective date, source, entered by
Business Partner	Finance/Commercial	Legal identity, roles, contacts, addresses, credit terms, bank details, tax/KYC data, status
Item / Service	Inventory/ Commercial	Code, category, stock flag, UOM, serial/batch flag, costing method, sales/purchase accounts, warranty
Warehouse / Bin	Warehouse	Physical/transit/virtual type, branch, responsible user, negative stock policy
Bank / Cash Account	Treasury	Bank, account number, currency, G/L account, branch, statement format, approval limits
Project / Contract	Projects	Customer, manager, WBS, budget, billing type, retention, status
Tax / Charge Code	Finance	Rate, recoverable/nonrecoverable, account mapping, effective dates
Payment Terms / Methods	Finance	Due-date rules, instalments, bank/cash/transfer method, fees
Document Sequences	System Admin	Prefix, year/branch pattern, next number, reset rules, document type

4.4 Master data governance

- Create, change and deactivate permissions must be separate from ordinary transaction entry.
- Duplicate searches run before saving business partners, items and bank accounts.
- Sensitive master changes, such as bank details, credit limits and posting accounts, require approval and before/after audit values.
- Masters are deactivated rather than deleted when referenced by transactions.
- Effective dates are used for exchange rates, prices, tax rates and approval roles.
- Bulk import requires validation preview, error file, import batch ID and rollback before final posting.

5 Security, Users, Roles, Workflow and Audit

5.1 User and department assignment

Every user shall be assigned to one or more authorised departments, branches and data scopes. Super Users retain full administration access. Operational access shall be granted by screen and action rather than by menu visibility alone.

5.2 Department Manager control

- The user record shall contain a Department Manager toggle for each assigned department.
- A user marked as Department Manager can create and finalise documents within that department without a second approval.
- A user who is not marked as Department Manager shall submit the document to the assigned Department Manager.

- Manager approval shall automatically execute the operational, inventory and accounting effects assigned to the document type.
- A user can be Department Manager in one department and an ordinary user in another.

5.3 Permission catalogue

Permissions shall include View, Create, Edit Draft, Submit, Approve, Execute, Post, Reverse/Cancel, Print, Export, Import, Configure and Administer. Department access and approval authority are separate settings.

5.4 Audit trail

The audit trail shall record user, date and time, action, section, record, before and after values, approval decision, reason, source device/session where available and links to original and reversing documents. Audit entries cannot be edited or deleted by application users.

5.5 IT implementation authority

The IT specialist shall implement the approved requirements, document technical constraints, perform technical and security tests and submit the as-built results. The IT specialist has no authority to change business processes, accounting logic, workflow rules or permission policy without written approval from Issa Mohammed.

6 CRM and Customer Management

CRM is the commercial relationship module. It captures prospective customers, enquiries, opportunities, activities and customer history before a Sales Order or Project exists. It uses the same Business Partner record used by Sales, Finance, Projects, Logistics and Money Transfer.

Module menu and principal screens

CRM Dashboard; Leads and Enquiries; Opportunities; Activities and Calendar; Contacts; Business Partner Onboarding; Customer 360; Campaign and Lead Source; After-Sales and Warranty Cases; CRM Reports; CRM Settings.

End-to-end workflow

1. Create or import a lead and assign an owner.
2. Qualify the lead and convert it to an opportunity.
3. Create or approve the Business Partner record when commercial activity requires it.
4. Record requested products, expected value, probability, activities and next action.
5. Convert the approved opportunity directly into a Sales Order or Project, according to the business line.
6. Retain traceability from lead to opportunity, order/project, invoice, receipt and after-sales case.

Core business rules and validations

- Duplicate detection by name, phone, email, registration number and bank details.
- A lead can exist without an approved Business Partner; a Sales Order, Project, invoice or service transaction cannot.
- Business Partner status supports Prospect, Active, On Hold, Blocked and Inactive.
- Completed activities and stage changes remain in the audit trail.
- Customer 360 respects department, branch and record-level permission.

Integration and data relationships

- Uses the central Business Partner master.
- Creates Sales Orders or Projects without duplicate data entry.

- Receives credit exposure, overdue balance and payment behaviour from Accounts Receivable.
- Receives order, delivery, invoice, receipt, project, logistics, transfer and warranty history.

Reports and dashboards

Pipeline by stage and owner; lead-source conversion; lost-opportunity reasons; customer activity; inactive customers; Customer 360 commercial and financial history.

Minimum acceptance criteria

- Lead-to-opportunity and opportunity-to-order/project conversion retain the same customer and source identifiers.
- Duplicate and blocked-customer controls are enforced.
- Customer 360 displays authorised operational and financial history.
- Every stage, ownership and master-data change is audited.

7 Sales and Order-to-Cash

Sales begins directly with a Sales Order. Price negotiation and external customer communication can occur through Excel outside the ERP, after which the authorised user creates or pastes the item lines into the Sales Order.

7.1 Module menu and principal screens

Sales Dashboard; Customer Price Lists; Sales Orders; Stock Reservations; Pick Lists; Delivery Notes; A/R Invoices; Cash Sales; Customer Receipts; Credit Control; Sales Returns; Customer Credit Memos; Warranty Inquiry; Sales Reports; Sales Settings.

7.2 Approved workflow

External Excel -> Sales Order -> Automatic Stock Reservation -> Pick List -> Goods Issue / Delivery Note -> A/R Invoice on the same delivery date -> Customer Receipt.

- Partial deliveries and multiple deliveries from one Sales Order are supported.
- One Sales Order may contain lines for multiple branches, warehouses and delivery locations.
- Proof of Delivery shall capture recipient name, signature, attachments and delivery photos.
- The normal product-sale process contains product items only; installation, transport and other services are not included in this Sales Order workflow.

7.3 Pricing, discounts and credit control

- Each Business Partner shall be linked to one designated Price List.
- Unit prices are retrieved from the customer's linked Price List and cannot be edited in the Sales Order.
- Discounts are allowed only at line level.
- Sales Orders created by ordinary Sales users require Sales Manager approval. Sales Orders created by the authorised Sales Manager finalise directly.
- Customer Credit Limit, Payment Terms, Available Credit, Outstanding Balance, Overdue Balance and Open Order Exposure shall be calculated in real time.
- The system shall block approval when the Credit Limit is exceeded. Only the Sales Manager can override the block, and the reason is mandatory.

7.4 Inventory, invoice and revenue rules

- Stock is reserved automatically when the Sales Order is approved.
- The system shall not approve a Sales Order when Available Stock is insufficient.
- Every inventory A/R Invoice shall be created from an approved Delivery Note.

- The A/R Invoice shall be issued on the same date as delivery.
- Warranty starts on the A/R Invoice date. Warranty duration is maintained in Item Master and the end date is calculated automatically.
- Cash Sales use the same inventory and invoice controls and record immediate cash or bank settlement.

7.5 Sales return

A/R Invoice -> Sales Return / Goods Return from Customer -> Inspection -> Saleable Warehouse, Quarantine Warehouse or Damaged Goods Warehouse -> Customer Credit Memo.

- Product exchange is not supported. Replacement requires a new Sales Order.
- Return quantity cannot exceed the invoiced quantity less previous accepted returns.
- Damaged returned goods cannot be sold.

7.6 Approved accounting events

Event	Debit	Credit
Delivery / A/R Invoice	Customer A/R; Cost of Goods Sold	Sales Revenue; Inventory
Cash sale settlement	Cash or Bank	Customer A/R
Credit memo and accepted return	Sales Returns; Inventory or Return Inspection	Customer A/R; Cost of Goods Sold

7.7 Minimum acceptance criteria

- Price List controls cannot be bypassed through the UI or API.
- Reservation, delivery, invoice and receipt quantities reconcile to the source Sales Order.
- Customer exposure includes open orders, invoices, receipts, credit memos and approved overrides.
- Every posted sales journal drills to the Sales Order, Delivery Note and A/R Invoice.

8 Procurement and Procure-to-Pay

Purchasing begins directly with a Purchase Order. Supplier quotation and price collection are handled outside the ERP through Excel. The supplier completes the Excel table, and the Purchasing employee copies the approved item and price lines into the Purchase Order.

8.1 Module menu and principal screens

Procurement Dashboard; Purchase Orders; Goods Receipts; Service Receipt / Expense Confirmation; A/P Invoices; Supplier Advances; Supplier Payments; Goods Returns; Supplier Credit Memos; Three-Way Match Exceptions; Supplier Performance; Procurement Reports; Procurement Settings.

8.2 Approved workflows

Inventory purchase: External Supplier Excel -> Purchase Order -> Goods Receipt -> A/P Invoice -> Supplier Payment.

Service or expense purchase: Purchase Order -> Service Receipt / Expense Confirmation -> A/P Invoice -> Supplier Payment.

Purchase return: A/P Invoice -> Goods Return -> Supplier Credit Memo.

Purchase Requisition, RFQ, Supplier Quotation, Quotation Comparison and a separate foreign-purchasing workflow are not part of the current build.

8.3 Purchase Order rules

- One supplier per Purchase Order.
- The supplier must be an active Business Partner with Supplier role.
- Lines can be Inventory Item, Service, Fixed Asset or Expense.
- Item selection uses the internal item code. Item name, supplier item code and barcode are retrieved from Item Master.
- Branch, destination warehouse and cost centre are defined at line level, allowing one Purchase Order to cover several branches and warehouses.
- The grid shall accept multi-line copy and paste from Excel and validate all item codes, UOMs, prices and required fields.

8.4 Receipt and matching controls

- Partial receipts, multiple receipts, over-receipt, under-receipt and configurable quantity tolerance are supported.
- The authorised manager can approve a quantity-tolerance override and must enter a reason.
- Receipt into a different warehouse is allowed and remains visible as a variance from the source line.
- Quarantine receipt states are Received in Quarantine, Inspected, Released to Warehouse or Rejected for Return. Quarantine stock is unavailable for sale.
- Every A/P Invoice must be created from both a Purchase Order and Goods Receipt, or from a Purchase Order and Service Receipt / Expense Confirmation.
- Three-Way Matching is mandatory. Quantity, price and value variances are allowed only after manager approval.

8.5 Supplier advances

- Supplier Advance Request and Supplier Advance Payment.
- Advance linked to Purchase Order.
- Automatic or manual partial settlement against A/P Invoice.
- Supplier refund and reversal controls.
- Prevention of duplicate settlement.

8.6 Department ownership

Document	Responsible department
Purchase Order	Purchasing
Goods Receipt and Goods Return	Warehouse
Service Receipt / Expense Confirmation	Benefiting department
A/P Invoice and Supplier Credit Memo	Finance
Supplier Advance and Supplier Payment	Finance / Treasury

8.7 Cancellation rules

- An unexecuted Purchase Order may be cancelled because it has no accounting or inventory effect.
- After partial receipt, only the remaining open quantity is closed; previous receipts remain unchanged.
- A prior receipt is reversed only through a separate Goods Return.
- Returned goods do not support replacement. A replacement requires a new Purchase Order.

8.8 Approved accounting events

Event	Debit	Credit
Goods Receipt	Inventory	Goods Received Not Invoiced
A/P Invoice for inventory	Goods Received Not Invoiced / approved variance accounts	Supplier A/P
Service or expense invoice	Expense or service cost	Supplier A/P
Supplier payment	Supplier A/P	Bank or Cash
Goods Return / Credit Memo	Supplier A/P or return clearing	Inventory / relevant cost or clearing account

9 Inventory and Warehouse Management

Inventory shall control quantity, availability, reservation, movement, serial/batch identity and FIFO cost across all branches and warehouses.

9.1 Warehouse types

Main Warehouse; Branch Warehouse; Transit Warehouse; Quarantine Warehouse; Damaged Goods Warehouse; Returns Warehouse. A branch can contain multiple warehouses.

9.2 Valuation and stock controls

- FIFO is the single valuation method for every item and warehouse.
- Negative inventory is prohibited without exception.
- Every inventory issue consumes the oldest available FIFO cost layers.
- A reversal restores the original quantity and cost relationship.

9.3 Mandatory tracking and units of measure

- Every stock item shall use Serial Number Tracking, Batch Number Tracking, or both Serial and Batch Tracking. No-tracking is not allowed.
- Manufacturing Date and Expiry Date shall be captured where the approved process requires it to the item.
- Warranty fields are optional. Warranty duration is configured in Item Master.
- Item Master shall support Base UOM, Purchase UOM, Sales UOM, conversion factors and barcodes by UOM.

9.4 Transfer workflow

Inventory Transfer Request -> Goods Issue from Source -> In Transit -> Goods Receipt at Destination.

- The destination warehouse shall confirm actual receipt before the transfer completes.
- Differences remain in Transit under Investigation.
- If the missing quantity is found, destination receipt is completed.
- If it is not found, the Warehouse Manager approves Inventory Loss and the system posts the loss.

9.5 Reservation and availability

Sales Order approval shall reserve stock automatically. The system shall show On Hand, Available, Reserved, In Transit, In Quarantine, Damaged, Returns Stock, Ordered from Suppliers and Committed to Customers by item, warehouse, branch and consolidated company.

9.6 Stock reconciliation

Stock Count Plan -> Physical Count -> Recount where required -> Variance Approval -> Inventory Adjustment.

- Count scope can be full, by warehouse, item, category or selected filter.
- The system quantity remains visible during counting.
- The system calculates physical-to-book differences.
- Inventory Loss requires Warehouse Manager approval.

9.7 Opening stock

Opening Stock shall be loaded through a dedicated controlled document containing item, branch, warehouse, quantity, UOM, FIFO unit cost, cost-layer date, serial/batch information and applicable manufacture, expiry and warranty data. Approval creates the inventory ledger and opening accounting entry.

9.8 Damaged goods

Damage Report -> Warehouse Manager Approval -> Transfer to Damaged Warehouse -> Inventory Write-Off.

Damaged goods cannot be reserved, sold or returned to saleable stock after final damage approval.

9.9 Minimum acceptance criteria

- Quantity subledger, FIFO valuation ledger and General Ledger reconcile.
- No UI, import or API transaction can create negative stock.
- Serial/batch traceability works from receipt to transfer, delivery, return and write-off.
- Transfer and count variances remain visible until completed or written off.

10 Projects and Contracting

Projects and Contracting manage customer work that has a defined scope, budget, timeline and profitability. The module must combine commercial, procurement, inventory, subcontractor, progress and billing data into one project view.

Accounting decision required

Before development of progress billing and WIP, Finance must approve the project revenue-recognition and cost-recognition policy. The system shall support configuration, but IT must not invent the accounting treatment.

Module menu and principal screens

- Project / Contract Master and Project Dashboard.
- Work Breakdown Structure (WBS), tasks, milestones and responsibilities.
- Project Budget by cost category, item, labour, subcontract and overhead.
- Contract terms, billing method, retention, advances, guarantees and key dates.
- Material Request, project stock reservation and project issue/return.
- Project Purchase Requests and supplier/subcontractor commitments.
- Timesheets, employee cost and equipment usage.
- Subcontract, service acceptance and subcontractor certificate.
- Progress Measurement, Client Certificate and Progress Invoice.
- Variation / Change Order and revised budget.
- Project Risk, Issue, Document and Approval registers.
- Project Closeout, final account and lessons learned.

End-to-end workflow

1. Create a project from an approved CRM opportunity or an approved management instruction.
2. Approve contract, budget, WBS and baseline dates.
3. Raise material, procurement, subcontract and labour requests against project and budget lines.
4. Record actual costs automatically from inventory issues, supplier invoices, timesheets, expenses and asset usage.
5. Measure progress and approve customer/subcontractor certificates.
6. Create milestone or progress invoices and track retention/advances.
7. Approve variations and update contract value, budget and forecast while preserving baseline.
8. Complete technical and financial closeout after all commitments, stock, billing and collections are resolved.

Core business rules and validations

- No project spending without an active project and valid budget/cost code where required.
- Budget checks distinguish budget, committed, actual, forecast and available amounts.
- Change orders are versioned and require commercial and budget approval.
- Project revenue recognition and WIP rules must be approved by Finance and aligned with applicable accounting policy.
- Retention and advances are separate balances, not ordinary revenue or expense.
- Project closure is blocked by open purchase orders, unreturned stock, unbilled costs, unapproved variations or unresolved advances/retention.

Integration and data relationships

- CRM opportunity or approved contract creates the project commercial baseline.
- Procurement and inventory automatically tag project commitments and actual costs.
- A/R creates project invoices and collects customer payments.
- A/P captures supplier/subcontractor costs and retention.
- HR/timesheets and employee expenses add labour and travel costs.
- Finance receives WIP, revenue, cost, accrual and provision entries according to approved posting rules.

Reports and dashboards

- Project P&L, contract value, billed, collected, cost, commitment, forecast and margin.
- Budget vs committed vs actual vs forecast by WBS/cost code.
- Project cash flow and working-capital exposure.
- Unbilled revenue, WIP, customer advances, retention and claims.
- Material issued/returned and stock at project site.
- Milestone, variation, risk and issue status.

Minimum acceptance criteria

1. A project shows all related opportunities, contracts, budgets, purchases, stock issues, costs, invoices and receipts.
2. Budget availability updates immediately after commitments and actual postings.
3. Variations preserve original baseline and show approved revised values.
4. Progress billing correctly calculates advance recovery and retention where configured.
5. Project closeout blocks unresolved financial and operational items.

11 Logistics Operations

Logistics is a separate revenue service. It manages customer import and shipping service jobs, direct third-party expenses and the separate logistics margin. A logistics job can be linked to the same client import file as a Money Transfer transaction without combining their accounting results.

11.1 Module menu and principal screens

Logistics Dashboard; Client Import Files; Service Jobs; Routes and Legs; Carriers; Shipping and Customs Documents; Client Charges; Third-Party Costs; Client Deposits; Job Settlement; Proof of Delivery; Claims and Exceptions; Customer Billing; Logistics Reports; Logistics Settings.

11.2 Approved workflow

Client Request -> Logistics Job -> Service Charge / Client Funding -> Carrier and Third-Party Execution -> Cost Recording -> Delivery Evidence -> Client Settlement / Billing -> Job Close.

11.3 Client-funded import relationship

- Goods imported for a client do not enter company warehouses.
- Goods remain in a financial intermediary account, Client Inventory, until delivery to the client.
- No Sales Invoice is issued for the goods because the company is providing a service rather than selling the goods.
- Money Transfer and Logistics are separate services with separate revenue, expenses and margin.
- Logistics charges paid by the client are added to the client account from the Logistics module.
- The company does not absorb logistics costs; direct logistics expenses are allocated to the job and deducted from the logistics service charge to determine job margin.

11.4 Accounting events

Event	Debit	Credit
Client logistics funding or charge	Bank, Cash or Client Account	Client Logistics Clearing / Deferred Service Balance according to document stage
Third-party logistics expense	Logistics Job Cost	Bank or Supplier A/P
Service completion and recognition	Client Logistics Clearing / Client A/R	Logistics Revenue

11.5 Required reports

Open Jobs; Client Import File Status; Job Revenue; Direct Cost; Gross Margin; Carrier Payables; Client Balances; Delivery Exceptions; Job Documents; Money Transfer and Logistics Cross-Reference.

12 Money Transfer Service

Money Transfer is a controlled service in which the client deposits IQD into a company bank account, the company initiates an IQD bank transfer based on a client-requested USD equivalent and approved exchange rates, and the remaining client balance after transfer and direct expenses represents the service result.

12.1 Module menu and principal screens

Money Transfer Dashboard; Client Accounts; Client Deposits; Transfer Instructions; Exchange Rate Reference; Initiate Transfer; Bank Execution Batch; Bank Fees and Direct Expenses; Returned Transfers; Client Refunds; Client Statements; Transfer Margin; Reconciliation; Money Transfer Settings.

12.2 Required transaction data

- Client Business Partner and client account.
- Requested USD equivalent for pricing and reference.
- Official exchange rate and client exchange rate.
- Actual IQD deposits and deposit dates.
- IQD transfer amount, company bank account, beneficiary and bank reference.
- Direct bank charges and other transfer expenses.
- Related Client Import File and Logistics Job where the approved process requires it.

12.3 Deposit and edit rules

- A client can make one or several partial deposits by cash deposit into the company bank account or by bank transfer.
- The client account remains open until the client confirms that funding is complete and specifies the amount to transfer.
- Rates and service details remain editable while only deposit entries exist.
- After Initiate Transfer creates the transfer entry, the transaction is locked. Correction requires full reversal and a new transaction.

12.4 Approved accounting model

Standard money transfer

Stage	Debit	Credit
Client deposit	Company Bank Account	Client Clearing / Client A/P-Type Account
Initiate and send transfer	Client Clearing / Client A/P-Type Account	Company Bank Account
Bank fees and direct expenses	Bank Fees / Money Transfer Direct Expense	Company Bank Account

The system shall calculate Total Client Deposits, Transfer Principal, Gross Exchange Spread, Direct Expenses, Net Service Margin and Remaining Client Balance. Account names are configured through Accounting Mapping; they are not hard-coded.

Client-funded import

Stage	Debit	Credit
Client deposit	Company Bank Account	Client Clearing / Client A/P-Type Account
Payment for client goods	Client Inventory	Company Bank Account
Delivery and financial settlement	Client Account	Client Inventory

- Client goods never enter company warehouses or company inventory quantities.
- No Sales Invoice is issued for the goods.
- Logistics revenue and costs are recorded separately in the Logistics module.

12.5 Bank Execution Batch

One bank debit can combine several internally separate transactions, such as a client transfer and a company import payment. Bank Execution Batch shall contain separate source lines that retain their own document, client/vendor, branch, cost centre, accounting and margin. The batch total shall reconcile to the single bank-statement amount.

12.6 Returned transfer

Initiated -> Sent -> Returned -> Refunded.

- The client receives a full refund.
- The company absorbs all bank charges.
- The system reverses the transfer and recognised service result.
- The original and reversing entries remain permanently linked.

12.7 Reports and acceptance criteria

Client Deposit Ledger; Open Client Balances; Transfer Register; Bank Execution Batch Reconciliation; Gross Spread; Direct Expenses; Net Margin; Returned Transfers; Refunds; Client Import Cross-Reference; Transfer-to-Bank Statement Reconciliation.

- Every transfer and refund reconciles to client subledger, bank ledger and General Ledger.
- The system prevents editing after Initiate Transfer.
- Bank Execution Batch lines sum exactly to the bank execution total.

13 Investment Management

Investment Management is a required ERP module. It shall maintain a controlled investment register, transaction history, income, valuation, impairment, maturity and disposal by approved investment category.

Scope discipline

The legal and accounting treatment of investments differs by instrument. The IT team must implement configurable types and posting rules only after Finance defines the required categories.

Module menu and principal screens

- Investment Type and Investment Master.
- Investment Proposal, business case and approval.
- Funding and acquisition transaction.
- Ownership percentage, units, counterparties and custody information.
- Income events: dividend, profit share, interest, distribution or other return.
- Valuation and impairment review.
- Additional funding / capital call.
- Partial or full disposal.
- Investment documents, agreements and expiry reminders.
- Portfolio dashboard and risk notes.

End-to-end workflow

1. Create investment proposal with amount, currency, type, expected return and risk.
2. Obtain management approval and funding source approval.
3. Record acquisition and create investment asset/register entry.

4. Record periodic income, valuation, impairment or additional funding.
5. Record disposal proceeds and calculate realised result.
6. Close/archive after all balances and documents are complete.

Core business rules and validations

- Investment type determines required fields and account mappings.
- Valuation methods and frequency require Finance approval.
- The system preserves historical valuations; it does not overwrite prior values.
- Income and disposal records require source evidence.
- Related-party status and approval are captured where the approved process requires it.
- Foreign-currency investments store transaction currency and base-currency equivalents.

Integration and data relationships

- Treasury provides funding and receives proceeds.
- Finance posts acquisition, income, valuation, impairment and disposal entries.
- Document management stores contracts, certificates and statements.
- BI combines investment cost, income, current value and realised/unrealised result.

Reports and dashboards

- Portfolio by investment type, currency, counterparty and status.
- Cost, current carrying value, income and total return.
- Maturity, review, document expiry and capital-call calendar.
- Realised and unrealised result with audit history.
- Investment cash-flow forecast.

Minimum acceptance criteria

1. An approved investment proposal creates a controlled acquisition record and accounting entry.
2. Historical valuations remain visible and attributable to approvers.
3. Income and disposal trace to bank transactions and supporting documents.
4. Portfolio reports reconcile to investment G/L accounts.

14 Core Financials and General Ledger

Core Financials is the accounting engine for all modules. Journal Entries belong exclusively to the Finance Department and can use only active accounts defined in the Chart of Accounts.

14.1 General Ledger menu

Finance Dashboard; Journal Entry; Recurring Journals; Reversal; G/L Inquiry; Account Activity; Trial Balance; Exchange Rates; Fiscal Periods; Soft Close; Year-End Close; Posting Mappings; Financial Statements; Reconciliation Reports.

14.2 Journal Entry specification

Header field	Rule
Journal Entry Number	Generated automatically and never reused.
Document Date	Required.

Header field	Rule
Posting Date	Required and controlled by period status.
Description	Required.
Attachment	Optional.
Created By / Approved By	Generated from workflow and audit data.

Each journal line shall contain G/L Account, Debit, Credit, transaction currency amount where the approved process requires it, IQD amount, USD reporting equivalent, Business Partner, Branch, Cost Centre, Project, Department, Service Line, Warehouse, Bank Account and Line Description. Only applicable dimensions need a value.

14.3 Journal rules

- One Journal Entry can contain one branch only.
- Cost Centre is optional or mandatory according to the Chart of Accounts setting for the selected account.
- Direct manual posting to customer, supplier, inventory, bank and control accounts is allowed only through Finance Journal Entry and requires Finance Manager approval.
- Exchange rate cannot be edited inside Journal Entry. Rates are maintained only in the Finance Exchange Rate section.
- IQD is the primary balancing currency. USD is a historical-rate reporting equivalent and does not replace IQD ledger values.
- The only manual journal type is Standard Journal. Recurring Journal templates create Standard Journal drafts.
- Manual Journal corrections use Full Reversal only.
- Reversal Date must equal or be later than the original Posting Date.

14.4 Approval and posting

- A Finance user creates and submits the Journal Entry to the Finance Manager.
- The Finance Manager can create and post a Journal Entry directly.
- Approval posts the Journal Entry automatically and locks it.
- A posted Journal Entry cannot be edited or deleted.

14.5 Recurring journals

The system shall maintain recurring templates for rent, payroll, subscriptions, periodic accruals, amortisation and other repeating entries. Each scheduled occurrence creates a reviewable Standard Journal draft and follows the Finance approval workflow.

14.6 Period control

The accounting period model is Soft Close. Normal users cannot post to a Soft-Closed period. Authorised Finance Manager users can post approved adjustments to the period. Posting dates earlier than the current date are allowed when the period permits posting.

14.7 Year-end close

- Close Revenue and Expense accounts.
- Transfer net profit or loss to Retained Earnings.
- Carry Balance Sheet accounts forward.
- Create opening balances for the new fiscal year.
- Block year-end close while Draft or Pending Approval financial documents, unresolved subledger reconciliations or incomplete bank reconciliations remain.

14.8 Minimum acceptance criteria

- Every journal is balanced in IQD.
- USD reports reproduce historical-rate equivalents consistently.
- Source-document journals drill back to the originating operational document.
- Trial Balance, subledgers and financial statements reconcile.

15 Accounts Payable

Accounts Payable maintains supplier liabilities from approved invoices through payment and reconciliation. It must support supplier statements, advances, debit/credit adjustments, withholding/tax configuration where the approved process requires it and detailed ageing.

Module menu and principal screens

- Supplier Account and Balance View.
- A/P Invoice, Credit Note and Debit Note.
- Supplier Advance / Prepayment.
- Invoice Matching and Exception Queue.
- Due Invoice and Payment Proposal.
- Payment Request Approval and Payment Batch.
- Supplier Statement Reconciliation.
- A/P Ageing and Cash Requirement Forecast.

End-to-end workflow

1. Create A/P invoice from purchase order/receipt or as an approved non-PO invoice.
2. Validate supplier, invoice reference, tax/charge, dimensions and matching status.
3. Approve and post liability.
4. Include due items in payment proposal based on due date, priority, discount and available cash.
5. Treasury executes payment and the system allocates it to invoices/advances.
6. Reconcile supplier statement and resolve unmatched items.

Core business rules and validations

- Supplier invoice number is unique per supplier unless a controlled duplicate exception is approved.
- Non-PO invoices require stronger approval and expense evidence.
- Supplier bank detail changes require independent verification and approval before payment.
- Payment amount cannot exceed approved available invoice/advance balance.
- Credit notes and advances are allocated transparently; unapplied balances remain visible.
- Blocked suppliers cannot be paid without an authorised override.

Integration and data relationships

- Procurement provides PO, receipt and matching data.
- Projects/logistics provide cost dimensions and service acceptance.
- Treasury executes bank/cash payments.
- G/L receives control account, expense/asset, tax, FX and payment entries.

Reports and dashboards

- A/P ageing by supplier, currency, branch and due bucket.
- Due and overdue invoices, payment forecast and discount opportunities.
- Unmatched invoices, receipt/invoice differences and blocked items.
- Supplier advances and unapplied credit balances.
- Supplier statement reconciliation and transaction history.

Minimum acceptance criteria

1. A/P invoice posts to supplier subledger and G/L control account with matching evidence.
2. Payment proposal includes only eligible approved items.
3. Payments allocate correctly and update ageing immediately.
4. Supplier statement reconciliation identifies unmatched items.
5. A/P subledger reconciles to the G/L control account.

16 Accounts Receivable and Credit Control

Accounts Receivable maintains customer invoices, deposits, receipts, allocations, ageing, credit limits and collection actions. It must provide a customer-level subledger and feed CRM/Sales with real-time exposure.

Module menu and principal screens

- Customer Account and Balance View.
- A/R Invoice, Debit Note and Credit Note.
- Customer Deposit / Advance.
- Receipt Entry and Bank/Cash Collection.
- Receipt Allocation and Unapplied Cash.
- Credit Limit, Credit Hold and Override.
- Collections Worklist, Promise to Pay and Follow-up Notes.
- Customer Statement and Confirmation.
- A/R Ageing and Expected Cash Collection.

End-to-end workflow

1. Post invoice from Sales, Projects, Logistics or other service module.
2. Calculate due dates according to payment terms and instalments.
3. Record customer receipt and identify customer/currency/bank reference.
4. Allocate receipt to invoice(s), deposit or on-account balance.
5. Update credit exposure and collection priority.
6. Issue statements, record collection actions and apply credit hold where needed.
7. Process credit note/refund through approval and treasury.

Core business rules and validations

- Customer credit exposure includes open invoices, open orders, delivered-not-invoiced amounts and guarantees/advances according to policy.
- Receipt allocation cannot exceed invoice or available receipt balance.
- Unidentified receipts remain in a clearing account until resolved.
- Credit limit overrides require reason, amount, expiry and approver.
- Customer statements show transaction currency and base-currency equivalent.

- Write-off requires defined threshold, approval and reason code.

Integration and data relationships

- Sales/Projects/Logistics generate invoices and credit notes.
- CRM receives credit status, ageing and collection history.
- Treasury records receipts, refunds and bank reconciliation.
- G/L receives control account, revenue, cash, FX and write-off entries.

Reports and dashboards

- A/R ageing and overdue analysis by customer, salesperson, business line and currency.
- Credit exposure, limits, holds and overrides.
- Expected cash collection and promise-to-pay tracking.
- Unapplied and unidentified receipts.
- Customer statement and account reconciliation.
- Days sales outstanding and collection effectiveness.

Minimum acceptance criteria

1. Invoices and receipts update customer subledger and G/L in the same posting.
2. Receipt allocation supports one-to-many and many-to-one matching.
3. Credit holds immediately affect order confirmation according to policy.
4. Customer statements reconcile to A/R ageing and G/L control.
5. Write-offs, refunds and credit notes require controlled approval.

17 Treasury, Bank and Cash Management

Treasury controls bank and cash accounts, receipts, payments, transfers, forecasts and reconciliation. It is the execution layer for A/P, A/R, payroll, investments, projects and Money Transfer.

Module menu and principal screens

- Bank and Cash Account Master.
- Payment Proposal and Payment Batch.
- Customer Receipt and Other Receipt.
- Bank Transfer between company accounts.
- Petty Cash, Cash Advance and Cash Count.
- Cheque Register if used.
- Bank Statement Import / Entry.
- Bank Reconciliation Workspace.
- Daily Cash Position and Cash Forecast.
- Foreign Currency Position and Funding Requirements.

End-to-end workflow

1. Receive approved payment/receipt instructions from source modules.
2. Select bank/cash account and validate available balance, currency and approval limits.
3. Generate payment batch and bank instruction/reference.
4. Record execution confirmation and update source items.
5. Import/enter bank statement and automatically match by amount, date, reference and counterparty.

6. Resolve unmatched items, bank fees, interest, returned payments and timing differences.
7. Complete reconciliation and lock the statement period.

Core business rules and validations

- Creator, approver and executor shall be different users for high-risk payments.
- Bank account currency must match payment currency or use an approved FX conversion transaction.
- Payments cannot use inactive/unverified beneficiary bank details.
- Cash accounts have custodians, limits and periodic cash counts.
- Bank reconciliation cannot be finalised with unexplained differences unless an authorised adjustment is posted.
- Statement lines are immutable after reconciliation; corrections use reopen/adjustment workflow.

Integration and data relationships

- A/P, payroll, expenses, investments, projects and Money Transfer send payment requirements.
- A/R, sales and services send receipt information.
- Bank reconciliation posts bank charges, interest, FX and unidentified transactions to clearing accounts.
- Cash forecast combines due A/P, expected A/R, project commitments, payroll and transfer funding.

Reports and dashboards

- Daily cash and bank balance by currency and account.
- Payments pending approval/execution and failed/returned payments.
- Bank reconciliation status and unmatched items.
- Cash-flow forecast by day/week/month and scenario.
- Foreign-currency exposure and funding requirements.
- Petty cash advances, ageing and cash count variances.

Minimum acceptance criteria

1. Payment batches enforce maker-checker controls and source approval.
2. Bank statement matching supports automatic suggestions and manual confirmation.
3. Reconciled bank balance agrees to the G/L for the same date.
4. Unmatched and unidentified items are reported and aged.
5. Treasury dashboard provides current and forecast liquidity by currency.

18 Fixed Assets

Fixed Assets shall maintain the complete asset register and reconcile acquisition cost, accumulated depreciation, impairment and disposal to the General Ledger.

18.1 Module menu and principal screens

Asset Categories; Fixed Asset Documents; Asset Register; Asset Assignment; Transfers; Depreciation Runs; Impairment; Disposal; Physical Verification; Warranty and Documents; Asset Reports; Fixed Asset Settings.

18.2 Acquisition and activation

- Finance creates the Fixed Asset Document directly from the approved purchasing evidence.
- No Asset Clearing Account is required by the approved company workflow.

- The document shall include Asset Code, Description, Category, Branch, Department, Cost Centre, Location, Custodian, Acquisition Cost, Useful Life, Residual Value, Depreciation Method and mandatory Available for Use Date.
- Depreciation starts from Available for Use Date in accordance with the approved IFRS treatment.

18.3 Lifecycle

Fixed Asset Document -> Available for Use -> Depreciation -> Transfer / Impairment where the approved process requires it -> Disposal -> Closed.

18.4 Accounting events

Event	Debit	Credit
Asset recognition	Fixed Asset Cost	Supplier A/P, Bank or approved source account
Depreciation	Depreciation Expense	Accumulated Depreciation
Impairment	Impairment Loss	Accumulated Impairment / Asset
Disposal	Bank/A/R and accumulated balances	Asset Cost and gain, or debit loss

18.5 Minimum acceptance criteria

- Depreciation cannot begin before Available for Use Date.
- Asset register and G/L balances reconcile by category, branch and cost centre.
- Transfer and disposal retain complete approval and document history.

19 Budgeting, Cost Control and Management Accounting

Budgeting and management accounting provide forward-looking control and profitability analysis. The module must compare approved budgets to commitments, actuals and forecasts using the same dimensions as operational transactions.

Module menu and principal screens

- Budget Version and Scenario Setup.
- Annual and Monthly Budget Entry / Import.
- Department, Cost Centre, Project and Business Line Budgets.
- Revenue, Expense, Capital and Cash Budgets.
- Budget Approval and Revision.
- Commitment Control and Budget Check.
- Forecast / Estimate at Completion.
- Cost Allocation Rules and Allocation Journal.
- Management P&L and Contribution Margin.

End-to-end workflow

1. Create budget assumptions and version.
2. Enter/import budget by account, period and dimensions.
3. Submit and approve budget with comments and revisions.
4. Activate approved budget for transaction controls.
5. Check purchase/project transactions against available budget.
6. Update forecast using actuals, commitments and revised estimates.

7. Run management allocations and compare actual vs budget vs forecast.

Core business rules and validations

- Budget versions are immutable after approval; revisions create a new version.
- Budget checks can warn, block or require override by account/category and threshold.
- Available budget equals approved budget plus approved revisions less commitments and actuals according to defined logic.
- Allocations use documented drivers and create auditable journals.
- Management reports distinguish statutory G/L presentation from internal management views.

Integration and data relationships

- Procurement and Projects create commitments.
- All posted modules create actuals by dimensions.
- Treasury uses budgets and commitments in cash forecasting.
- BI provides variance drill-down to source transactions.

Reports and dashboards

- Budget vs actual vs commitment vs forecast by account/dimension.
- Department and project budget availability.
- Revenue and gross-margin forecast by business line.
- Operating expense variance and top drivers.
- Capital expenditure plan and asset acquisitions.

Minimum acceptance criteria

1. Approved budgets are available to transaction-level checks.
2. Commitments update on approved purchase orders/contracts and release when closed/cancelled.
3. Variance reports drill down to source documents.
4. Budget revision history and approvals are preserved.
5. Allocation journals reconcile and can be reversed.

20 HR, Payroll, Employee Expenses and Advances

HR, Payroll, Employee Expenses and Advances are required ERP modules. They shall use the same employee, branch, department, cost centre, project, bank-account, approval and accounting structures as the rest of the ERP.

required sequencing

Implement HR master, employee expenses and advances before full payroll if local payroll rules are not yet documented. Payroll shall not be programmed from assumptions.

Module menu and principal screens

- Employee Master, contracts, position, department and manager.
- Attendance, shifts and timesheets.
- Leave requests and balances.
- Payroll components, payroll run and payslip.
- Employee Expense Claim and approval.

- Travel Request and Per Diem.
- Employee Advance / Loan and settlement.
- Employee Asset Assignment.
- Recruitment, onboarding and offboarding checklist.
- HR documents and expiry reminders.

End-to-end workflow

1. Create approved employee and link user account where needed.
2. Capture attendance/timesheet/leave according to policy.
3. Prepare payroll, review exceptions and approve payroll batch.
4. Generate payment instruction to Treasury and post payroll journal.
5. Submit expenses/advances with receipts and project/cost-centre dimensions.
6. Approve, pay and settle advances; recover balances through payroll where approved.
7. Deactivate access and recover assets during offboarding.

Core business rules and validations

- Payroll data is highly restricted and separated from general user permissions.
- Payroll formulas, statutory deductions and benefits require signed HR/Finance specification.
- Employees cannot approve their own expenses or advances.
- Expense policy limits and required receipts are configurable.
- Open advances and assigned assets appear in offboarding clearance.
- Sensitive employee data is not included in general audit exports or reports without permission.

Integration and data relationships

- Organisation/department masters and user accounts are shared with the platform.
- Timesheets and expenses feed project cost.
- Treasury pays payroll, expenses and advances.
- Finance posts payroll expense, liabilities, advances and settlements.
- Fixed Assets tracks assigned company assets.

Reports and dashboards

- Headcount, attendance, leave and turnover.
- Payroll summary and reconciliation to G/L/bank.
- Employee expense by department/project and policy exception.
- Outstanding advances and loans.
- Assigned assets and offboarding clearance.

Minimum acceptance criteria

1. Payroll calculations reproduce approved test cases and reconcile to payment and G/L totals.
2. Employee expenses and advances enforce approval and receipt rules.
3. Project timesheets/expenses update project actual cost.
4. Offboarding revokes system access and lists unresolved advances/assets.

21 Document Management, Notifications and Collaboration

This cross-functional module provides the supporting evidence, task routing and communication layer required by every transactional module. It must not become an uncontrolled file store; attachments, versions, approvals and retention must remain linked to a business record.

Design boundary

The module records business evidence and collaboration around ERP transactions. It is not intended to replace a full enterprise content-management platform unless that scope is approved separately.

Module menu and principal screens

- Document Centre: search by module, document number, business partner, project, date, document type and tag.
- Attachment panel embedded in every master and transaction record.
- Document types and checklists: contract, purchase order, delivery note, invoice, bank advice, customs document, KYC document, warranty certificate, technical drawing and approval memo.
- Version history, check-in/check-out where editing is permitted, expiry date and renewal owner.
- Internal notes, @mentions, assignments, due dates and completion status.
- Notification centre: approvals, exceptions, expiries, overdue tasks, low stock, failed integrations and period-close tasks.
- Templates and outbound correspondence: order, invoice, statement, transfer confirmation and approval notification.
- Retention and legal-hold administration.

End-to-end workflow

1. A user uploads or generates a document from the related business record.
2. The system validates file type, size, malware scan result, required metadata and user permission.
3. The file is stored using an immutable object identifier and linked to the parent record; later versions do not overwrite prior versions.
4. A checklist item or workflow step may require the attachment before submission, approval, posting or settlement.
5. Notifications are generated from business events and routed to in-app inbox, e-mail or other approved channels.
6. At the end of the retention period, authorised administrators may archive or dispose of the document according to company policy; transactional history remains intact.

Core business rules and validations

- Attachments inherit the confidentiality and access policy of the parent record, with optional stricter document-level classification.
- No executable file types shall be accepted unless explicitly authorised and technically isolated.
- Every upload, download, replacement, external share, expiry-date change and deletion request is logged.
- Financial evidence attached to a posted transaction is immutable; replacement creates a new version with reason and approver.
- External sharing must use expiring links, named recipients and download logging; public anonymous links are prohibited by default.
- Notification rules must suppress duplicates, record delivery status and allow escalation if a task is not acted upon.
- System notifications are not a substitute for workflow status. A missed e-mail must never change the underlying approval requirement.
- Retention periods, legal holds and confidentiality classifications are configurable rather than hard-coded.

Integration and data relationships

- All operational modules, workflow engine, identity and access management, e-mail service, object storage, audit trail and reporting.
- KYC/compliance records are linked to the business partner and relevant Money Transfer cases.
- Contracts and project documents are linked to both project and customer/vendor records.
- Generated PDFs must retain a reference to the source transaction and template version.

Reports and dashboards

- Missing mandatory documents by process or status.
- Documents approaching expiry and overdue renewals.
- Uploads/downloads by user and sensitive-document access.
- Notification delivery, failure and escalation statistics.
- Open tasks by owner, due date, process and priority.

Minimum acceptance criteria

1. A configured document checklist can block workflow submission until all required evidence is attached.
2. Users cannot access an attachment when they cannot access its parent record.
3. Replacing a posted document preserves the original and records reason, user, date and approval.
4. Notifications are generated once per qualifying event and escalation works according to configured time limits.
5. Document searches return only records allowed by the user's role and data scope.

22 Reporting, Dashboards and Management Information

Reporting must provide one reconciled version of financial and operational truth, from executive summary to document-level drill-down. Dashboards are derived from posted or clearly labelled provisional data; they do not maintain separate balances.

Reporting principle

A dashboard is a presentation layer, not an accounting ledger. The G/L and validated subledgers remain the books of record.

Module menu and principal screens

- Executive Dashboard: revenue, gross margin, operating profit, cash, receivables, payables, inventory, projects and transfer exposure.
- Finance Dashboard: trial balance health, unposted documents, overdue reconciliations, close progress and exception accounts.
- Sales/CRM Dashboard: pipeline, opportunities, orders, sales, collections, margin and salesperson/customer performance.
- Procurement Dashboard: spend, open commitments, supplier delivery, price variance and overdue approvals.
- Inventory Dashboard: stock value, ageing, availability, slow/non-moving items, transfers and count variances.
- Project Dashboard: contract value, progress, cost, margin, billing and cash collection.
- Logistics Dashboard: jobs, utilisation, third-party costs, profitability and proof-of-delivery exceptions.
- Money Transfer Dashboard: client deposits, open transfers, balances, rate spread, fees, bank exposure and compliance exceptions.
- Report Designer / saved views for authorised power users.
- Scheduled report distribution and controlled exports.

End-to-end workflow

1. A report request identifies company/entity, fiscal period, currency, status basis, dimensions and user data scope.
2. The reporting layer reads from governed views or a reporting model reconciled to the transactional ledger.
3. Totals can be drilled from statement line to account, journal, source document and attachment.
4. Users can save filter views and schedule delivery when they have export permission.
5. Published management packs are versioned and frozen for the reporting date, with preparer and approver.

Core business rules and validations

- Every financial report shows base currency, reporting period, run time, data status and filter criteria.
- Posted and unposted amounts must never be combined without an explicit visual distinction.
- Financial statements are generated from account-to-report-line mappings, not hard-coded account numbers.
- Operational reports reconcile to subledger controls; financial reports reconcile to the G/L.
- Row-level security is enforced in the query layer, not only hidden in the screen.
- Exports include report title, filters, generated-by and generated-at metadata where practical.
- Material KPI definitions, owners and formulas are documented in a KPI dictionary.
- Historical reports use the rates and mappings valid for the reporting period unless an authorised restatement is performed.

Integration and data relationships

- General ledger, all subledgers, data warehouse/reporting database, master data, workflow and document management.
- A common semantic layer defines customer, supplier, item, project, department, warehouse, currency and period consistently.
- External BI tools may connect only through read-only governed datasets or APIs.

Reports and dashboards

- Core financial statements: Trial Balance, Statement of Profit or Loss, Statement of Financial Position, Cash Flow, Statement of Changes in Equity and supporting schedules.
- A/R and A/P ageing; customer/vendor statements; cash forecast and bank position.
- Sales, purchase, inventory, project, logistics, transfer and investment reports listed in their respective modules.
- Audit and control reports: user access, approval overrides, reversals, master-data changes, duplicate detection and interface failures.
- Management profitability by revenue stream, customer, project, item/category, branch, warehouse and other approved dimensions.

Minimum acceptance criteria

1. Every statement total can be drilled to balanced journal entries and original source documents.
2. A/R, A/P, inventory, fixed asset, bank and client-funds control reports reconcile to the G/L for a test period.
3. Users see only permitted sections and data scopes in both screen and export.
4. Saved views and scheduled reports preserve filters and produce reproducible results.
5. A published management pack can be re-opened with its original data cut, version and approvals.

Minimum KPI dictionary

KPI	Definition / calculation basis	Primary owner	Drill-down
Revenue	Posted revenue for the selected period, excluding cancelled/reversed entries and presented by approved recognition policy.	Finance	Revenue stream → customer/project/item → invoice → journal.

KPI	Definition / calculation basis	Primary owner	Drill-down
Gross margin	Revenue less directly attributable cost of goods/services, using the approved cost and project allocation rules.	Finance / Operations	Business line → transaction → cost layers/cost postings.
Days sales outstanding	Receivable collection indicator calculated from the approved management formula and documented period basis.	Finance	Customer → invoice → receipt/allocation.
Inventory availability	On-hand less reserved plus/minus approved in-transit logic, by item and warehouse.	Warehouse / Sales	Item → warehouse/bin → movement.
Purchase commitment	Approved purchase orders not yet fully received/invoiced, translated to reporting currency.	Procurement / Finance	Supplier → PO → receipt/invoice.
Project forecast margin	Contract revenue forecast less actual and forecast-to-complete cost.	Projects / Finance	Project → WBS → cost/revenue transactions.
Transfer margin	Approved client rate economics less actual transfer cost, fees and recognised FX effects according to finance policy.	Treasury / Finance	Client → case → deposit → settlement → journal.
Cash position	Cleared and book balances by bank/cash account and currency, with unreconciled items separately disclosed.	Treasury	Account → statement → transaction/reconciliation.

23 Integrations, APIs and External Interfaces

The ERP shall expose controlled, versioned interfaces for approved external systems without granting direct database access.

Module menu and principal screens

- Integration Catalogue and endpoint registry.
- API client/application management with scopes, secrets/certificates and expiry.
- Inbound/outbound message monitor, retry queue and dead-letter queue.
- File-import centre for bank statements, master data and migration files.
- Webhook/event subscription management.
- Integration mappings: external code to ERP master/document.
- Interface reconciliation and exception dashboard.
- Technical logs with correlation identifiers.

End-to-end workflow

1. An external system authenticates using an approved machine identity and submits or requests data through a versioned API or controlled file channel.
2. The gateway validates schema, scope, idempotency key, rate limit and business rules.
3. Accepted messages receive a correlation ID and are processed atomically or queued.
4. The ERP returns a clear success, validation error or retrievable/non-retrievable failure.
5. Failed messages enter an exception queue with retry policy, ownership and alert.
6. Interface totals and record counts are reconciled to source and target.

Core business rules and validations

- Direct writes to production ERP tables by external systems are prohibited.
- Every create/update API must enforce the same permissions and business validations as the user interface.
- Idempotency keys prevent duplicate documents when a sender retries.
- APIs are versioned; breaking changes require a new version and deprecation period.
- Secrets are stored outside source code, rotated and never included in logs.
- Sensitive fields are encrypted in transit and masked in support logs.

- Message payload retention follows data classification and legal policy.
- An interface cannot post accounting entries without a defined source type, posting profile and reconciliation owner.
- Time-outs and partial failures must not leave half-created business documents.

Integration and data relationships

- Potential interfaces: banks/statement files, e-mail, object storage, identity provider, BI platform, SMS/notification provider, payment gateways, POS/e-commerce, customs/logistics providers and future customer/vendor portals.
- Event examples: opportunity converted, purchase order approved, goods received, invoice posted, payment applied, stock below threshold, transfer settled and project milestone approved.
- Master-data ownership is defined per interface to avoid conflicting updates.

Reports and dashboards

- Interface volume, latency, success/failure and retry metrics.
- Unmatched external codes and duplicate-message prevention events.
- Source-to-target control totals and unreconciled interface batches.
- API usage by client, scope and endpoint.
- Security events: invalid token, forbidden action, rate-limit breach and suspicious payload.

Minimum acceptance criteria

1. Repeated delivery of the same idempotent request creates only one ERP transaction.
2. Invalid or unauthorised requests are rejected without partial data changes.
3. Every interface transaction can be traced using a correlation ID from source to ERP record and audit log.
4. Failed messages can be corrected and replayed without editing production tables.
5. Reconciliation reports prove completeness for an agreed interface test batch.

Minimum API design conventions

Area	Requirement
Authentication	Machine identities with least-privilege scopes; short-lived tokens or mutually authenticated certificates where appropriate.
Authorisation	Server-side permission and data-scope checks for every request and every record.
Identifiers	Stable UUID/internal ID plus human-readable document number; external reference stored separately.
Validation	Structured field-level and business-rule errors; no stack traces or sensitive internals returned.
Idempotency	Required for create/post/payment/settlement operations; duplicate keys return the original result.
Concurrency	Optimistic version or equivalent conflict detection for updates; explicit locking for critical posting/settlement.
Pagination	Cursor or stable page pagination for large lists; deterministic sorting.
Auditability	Actor/client, source IP where lawful, request ID, event, target and outcome logged.
Observability	Correlation ID, metrics, tracing and health endpoints without exposing secrets.
Compatibility	Published schema, semantic versioning, test environment and deprecation notice.

24 Data Architecture, Document Statuses and Posting Engine

This section defines the common technical behaviour that prevents each module from inventing its own status logic, numbering, balances or accounting implementation.

Implementation rule

Module developers shall call shared services for numbering, currency, workflow, posting, attachments and audit logging. Duplicating these mechanisms inside each module will create inconsistent controls and expensive maintenance.

Module menu and principal screens

- Reference data and configuration administration.
- Document numbering and fiscal-period sequence management.
- Posting profiles and account determination rules.
- Document status and transition configuration.
- Background jobs and scheduler.
- Data-quality rules and duplicate detection.
- Posting preview, posting log and failed-posting queue.
- Period locks and reprocessing controls.

End-to-end workflow

1. A business document is created in Draft with header, lines, dimensions, currency and references.
2. Validation checks mandatory fields, master-data status, quantities, amounts, dates, open period, permissions and duplicate conditions.
3. Submission freezes controlled fields and starts the approval workflow.
4. Approval permits the authorised business action; approval itself does not automatically mean accounting posting unless configured.
5. Operational execution records receipt, delivery, service completion, bank movement or other evidence.
6. Posting calls the central engine, resolves accounts/dimensions/rates, generates a balanced journal and subledger entries within one database transaction.
7. The source document stores posting identifiers and becomes Posted/Completed as applicable.
8. Correction uses authorised cancellation, credit note, return or reversal; the original remains linked and visible.

Core business rules and validations

- Header-line architecture is used for documents with multiple items/services; totals are calculated, not manually stored without reconciliation.
- Posted journals and subledger entries are append-only; corrections create new linked entries.
- All money fields store transaction currency amount, base currency amount, currency and rate/reference.
- Quantities store unit of measure and conversion basis; stock movements use the base inventory unit.
- All dates distinguish document date, posting date, due date, tax date if required, and system timestamps.
- Every record includes created-by/at, updated-by/at, status, version and legal entity/branch scope where the approved process requires it.
- Soft deletion is limited to eligible draft/configuration records; posted transactions are never deleted.
- Account determination is configuration-driven using transaction type, item/service group, partner group, warehouse, project and other approved criteria.
- Posting must be atomic: either all journal/subledger/inventory records commit, or none do.

- Each posting batch includes a deterministic source reference to prevent duplicate posting.
- Document status transitions are allow-listed and checked server-side.
- Balances are derived from immutable entries or controlled balance tables that reconcile to them.

Integration and data relationships

- All master data, workflows, modules, general ledger, audit trail, reporting and integration framework.
- The posting engine emits events after commit so downstream notifications cannot cause partial financial posting.
- Reporting reads posted journals and validated subledger entries through governed views.

Reports and dashboards

- Posting exception queue and root cause.
- Documents stuck in a status beyond target time.
- Unbalanced or orphan-entry integrity report, expected to be zero.
- Duplicate source references and sequence gaps.
- Master records missing mappings or default dimensions.
- Period-lock override and back-dated posting report.

Minimum acceptance criteria

1. Posting the same source event twice does not duplicate financial or inventory effects.
2. Forced technical failure during posting leaves no partial journal, subledger or stock movement.
3. Every journal line traces to source document, source line, posting rule and user/system actor.
4. Invalid status transitions are rejected from both UI and API.
5. Integrity checks prove all journals balance and all control accounts reconcile for the acceptance dataset.

Common document status model

Status	Meaning	Editing rule	Typical next states
Draft	Incomplete working record not yet submitted.	Editable by authorised creator/role.	Submitted, Cancelled.
Submitted	Validation passed and approval requested.	Controlled fields locked; recall may be allowed.	Approved, Rejected, Recalled.
Approved	Required approvals completed.	Commercial terms locked except controlled amendment.	In Progress, Partially Executed, Executed, Cancelled.
Partially Executed	Some quantity/value completed.	Remaining quantity/value controlled.	Executed, Closed, Cancelled balance.
Executed / Received / Delivered	Operational event completed.	No destructive edit; use return/correction.	Invoiced, Settled, Closed.
Posted	Accounting/subledger entries committed.	Immutable; correction through reversal/ credit/return.	Reversed, Settled, Closed.
Settled	Payment/receipt/transfer matching completed.	Allocation changes controlled and audited.	Closed, Reopened by exception.
Rejected	Approver declined with reason.	May return to Draft as a new revision.	Draft/Resubmitted, Cancelled.
Cancelled	Unposted document withdrawn.	Read-only; reason mandatory.	None or Copy to New.
Reversed	Posted effect neutralised by linked reversal.	Original and reversal read-only.	Corrected replacement document.
Closed	No further normal action expected.	Read-only except authorised administrative notes.	Reopened only through controlled exception.

Minimum core entities and relationships

Entity	Key relationships	Important controls
Business Partner	Roles, addresses, contacts, currencies, bank accounts, credit terms, KYC, opportunities, sales/purchases/transfers.	Duplicate detection; role-specific mandatory fields; approval of sensitive changes.
Item / Service	Category, UOM, warehouses/bins, price lists, valuation, purchase/sales lines, BOM/kit where approved.	Stock/service flag; account determination; inactive-date enforcement.
Project / Contract	Customer, WBS, budget, milestones, resources, purchase/sales/logistics transactions and journals.	Status, budget and change control; mandatory project dimension.
Commercial Document	Header, lines, partner, currency, taxes/charges, dimensions, references, approvals and attachments.	Version, status transition, totals, duplicate reference.
Inventory Movement	Item, warehouse/bin from/to, quantity, cost layer, source line and posting journal.	No negative stock unless policy; atomic quantity and value.
Journal Entry	Batch, header, lines, account, dimensions, currency, source and reversal links.	Debit=credit; open period; approved account; immutable after posting.
Bank Statement Line	Bank account, statement, date/value date, amount, reference and reconciliation match.	Unique import key; match status; book-to-bank reconciliation.
Workflow Instance	Definition version, document, steps, actors, decisions, timestamps and delegation.	No self-approval where prohibited; complete decision history.
Attachment	Object ID, version, parent record, classification, hash and retention data.	Access inheritance; malware scan; immutable posted evidence.
Audit Event	Actor, action, target, before/after or event payload, timestamp, channel and outcome.	Append-only; protected from normal user alteration.

25 Non-Functional and Technical Requirements

Functional requirements and the following security, continuity, performance, usability and support requirements are mandatory implementation constraints.

Security and privacy

- Use deny-by-default, server-side authorisation for every page, API and record. Navigation hiding alone is not access control.
- Support strong password policy, temporary-password setup, multi-factor authentication for privileged and high-risk roles, session expiry and immediate revocation.
- Apply least privilege and segregation of duties; privileged access is time-bound where feasible and reviewed periodically.
- Encrypt network traffic using current supported protocols; encrypt sensitive stored data and manage keys separately from application code.
- Mask bank details, identity documents and other sensitive fields according to role and purpose.
- Protect against common web risks using secure coding, dependency management, input validation, output encoding, CSRF controls, rate limiting and secure file handling.
- Record security-relevant events including authentication, authorisation failures, privilege changes, exports, configuration changes and sensitive-data access.
- No passwords, tokens, private keys, full sensitive document contents or unnecessary personal data in logs.
- Define data classification, retention, lawful access and incident response responsibilities before go-live.
- Perform independent penetration testing and remediate agreed severity findings before production launch.

Availability, continuity and recovery

Requirement area	Minimum business requirement to be confirmed
Service availability	Production availability target and authorised maintenance window; critical posting unavailable events are alerted.
Recovery Point Objective (RPO)	Maximum acceptable data loss expressed in time, separately for production database and attachments.
Recovery Time Objective (RTO)	Maximum acceptable time to restore critical operations after an outage.
Backups	Automated encrypted backups, off-system/off-site copy, retention schedule and monitored success/failure.
Restore testing	Scheduled full restore tests to an isolated environment with evidence and measured recovery time.
High availability	Database/application design appropriate to the approved RTO; no single undocumented point of failure.
Disaster recovery	Documented invocation criteria, roles, contacts, alternate environment and return-to-primary procedure.
Business continuity	Manual contingency for critical receipts, deliveries, bank movements and approvals during outage, followed by controlled capture.

Performance and scalability

- Define target concurrent users, annual transaction volumes, attachment volume, integration throughput and data-retention horizon before sizing.
- Normal list/search screens shall use pagination and indexed filters; large exports and reports run asynchronously.
- Posting performance targets must cover normal documents and high-line-count documents without sacrificing atomicity.
- Dashboards use governed aggregates/read replicas where needed, not expensive uncontrolled queries on the posting path.
- Load and endurance tests must include peak month-end activity, imports, background jobs and simultaneous reporting.
- Performance monitoring records response time, database latency, queue depth, error rate and capacity trends.

Usability and accessibility

- Consistent navigation, terminology, status colours, action placement and keyboard behaviour across modules.
- Responsive web design for approved desktop/tablet/mobile scenarios; financial entry remains optimised for desktop where appropriate.
- English is the initial business language; localisation architecture shall allow Arabic labels and right-to-left layout later without redesign.
- Dates, currencies, quantities and number formats are explicit and cannot be misread across locales.
- Validation messages identify the field, reason and corrective action; no generic “something went wrong” for business errors.
- Accessibility shall target a recognised web accessibility level selected by the company, including keyboard navigation and meaningful labels.

Maintainability, support and operations

- Use separate development, test/UAT and production environments with controlled promotion; production changes are never made directly.
- Database schema changes use versioned migrations with rollback or recovery plan and tested backup.
- Configuration is separated from code and changes are audited.
- Automated unit, integration and end-to-end tests cover critical posting and permission paths.
- Application, database, job, integration and security monitoring feed a support dashboard with alert ownership.
- Support tools may inspect status and retry safe jobs but may not edit posted financial data.
- Technical and business documentation is version-controlled and updated with each release.

- Every release has scope, migration notes, test evidence, approvals and rollback plan.

Acceptance criteria

1. Security testing confirms inaccessible modules and records cannot be reached through direct URL or API.
2. Backup restoration succeeds in an isolated test and meets the approved recovery objectives.
3. Peak-load tests meet approved response and posting targets without errors or data inconsistency.
4. A failed deployment can be rolled back or recovered according to the release plan.
5. Operational monitoring detects a simulated failed job, failed integration, authentication attack pattern and backup failure.
6. All critical business processes have runbooks, owners and support escalation contacts.

26 Data Migration, Testing, Training and Go-Live

Migration, testing, training and go-live shall be controlled accounting and operational activities with reconciliation and acceptance evidence.

Migration scope

Data class	Typical content	required treatment
Configuration	Fiscal periods, currencies, exchange rates, sequences, workflows, posting profiles and report mappings.	Build and approve in test; promote through controlled release.
Master data	Accounts, partners, items, warehouses, banks, projects, employees, price lists and opening classifications.	Cleanse, deduplicate, map, approve, then import with source ID.
Open operational documents	Open opportunities/orders, undelivered/received quantities, projects, logistics jobs and transfer cases.	Migrate only if required for continued processing; validate status and remaining balances.
Subledger openings	Customer/vendor open invoices, advances, credit notes, client funds, bank reconciling items, inventory by location/cost and fixed assets.	Line-level migration with control-account reconciliation.
G/L opening balances	Account and dimension balances at cut-over date.	Balanced journal linked to migration batch; no unexplained suspense.
Historical transactions	Prior invoices, orders, journals and documents.	Import selected detail only when business value justifies complexity; otherwise retain read-only archive.
Attachments	Contracts, invoices, receipts, KYC, customs and project evidence.	Migrate with metadata, classification, hash and parent linkage; sample-test accessibility.

Migration cycle

1. Approve the migration strategy, data owners, cut-off date, historical depth and archive approach.
2. Profile source data and issue a data-quality report covering duplicates, missing keys, invalid dates/currencies, inactive masters and unreconciled balances.
3. Define source-to-target mappings, transformations, default values and rejection rules.
4. Clean and approve source data outside production; retain original extracts unchanged.
5. Run at least two rehearsal migrations in a representative environment.
6. Reconcile record counts, quantities, values, control accounts, ageing and opening financial statements.
7. Obtain business-owner sign-off for each data domain.
8. Freeze source changes according to the cut-over schedule, execute final extract/import and repeat reconciliation.
9. Store migration batch IDs, source IDs, import logs, rejected records and approvals for audit.

Testing layers

Test layer	Purpose	Minimum evidence
Unit testing	Validate functions, calculations, status rules and account determination in isolation.	Automated test results and coverage of critical rules.
Integration testing	Validate module-to-module, API, posting, document and notification behaviour.	Traceable scenarios, interface payloads and reconciliations.
System testing	Validate complete configured ERP in a production-like environment.	End-to-end scripts and defect log.
Security testing	Validate authentication, authorisation, data scope, secure configuration and vulnerabilities.	Access matrix tests, scan/penetration report and remediation.
Performance/recovery testing	Validate peak load, backup, restore, failover and job recovery.	Measured results against targets.
User Acceptance Testing	Business users prove real processes and outputs meet approved requirements.	Signed scripts, screenshots/reports, defect disposition and approval.
Parallel run	Compare selected live-cycle results with the existing process before full cut-over.	Reconciliation pack and management decision.

Critical end-to-end UAT scenarios

- Lead → opportunity → Sales Order → reservation → partial delivery → A/R Invoice on delivery date → receipt → allocation → customer statement → G/L and margin report.
- External supplier Excel → Purchase Order → partial receipt → Three-Way Match → A/P Invoice → payment → bank reconciliation → G/L.
- Warehouse transfer with shipment, in-transit stock, receipt, discrepancy and cost reconciliation.
- Inventory count with freeze/cut-off, variance approval and posting.
- Project contract → budget → procurement/timesheet/expense → milestone → invoice → revenue/cost/margin reporting.
- Logistics job → vendor costs → customer charge → proof of delivery → invoice and profitability.
- Money Transfer client onboarding → KYC approval → deposit → quoted rate → transfer execution → settlement → bank reconciliation → client balance and margin.
- Foreign-currency invoice/payment and period-end revaluation with reversal in the next period where policy requires.
- Journal creation → approval → posting → reversal and source/audit trace.
- Month-end close checklist → subledger reconciliations → lock → financial statements → controlled reopen.
- User role change, session revocation, forbidden direct URL/API attempt and audit evidence.
- Integration duplicate retry and failure recovery without duplicate posting.

Training and change management

- Role-based curricula: Super User, Finance, Sales, Procurement, Warehouse, Projects, Logistics, Treasury/Transfer, HR and Management.
- Train-the-trainer sessions and named process champions per department.
- Business process guides with screenshots, field definitions, decision rules and exception handling.
- Practice environment with realistic data and no production consequences.
- Competency checks for users who post, approve, reconcile or administer access.
- Go-live communication, support channels, daily issue review and escalation matrix.

Cut-over and hypercare

- Detailed hour-by-hour cut-over plan, owners, prerequisites, decision points and rollback criteria.
- Final backup/export from legacy sources and documented transaction freeze.
- Opening data import and independent reconciliation before users are released.

- Controlled activation of interfaces, jobs, document numbering and user accounts.
- Daily reconciliation of cash, banks, receivables, payables, inventory and key revenue streams during hypercare.
- Defects triaged by severity; financial integrity issues receive immediate containment.
- Formal exit criteria from hypercare and transfer to normal support.

Go-live acceptance gate

1. No unresolved critical defect and no material unexplained reconciliation difference.
2. Opening statement of financial position and subledger controls are signed by Finance.
3. Critical users completed training and access was approved by management.
4. Backups, monitoring, support, incident response and rollback procedures were tested.
5. Legal/compliance approval exists for regulated service processes, especially Money Transfer.
6. Executive sponsor signs the production-readiness decision.

27 Implementation Roadmap

The ERP shall be delivered in controlled releases. Each release must work end to end, reconcile operational and accounting records and pass acceptance before dependent functionality is moved to production.

Release	Mandatory scope	Acceptance dependency
1 - Foundation	Users, department roles, manager controls, permissions, audit trail, company settings, branches, document numbering.	Authentication, server-side access and audit tests pass.
2 - Master Data	Chart of Accounts, exchange rates, Business Partners, items, UOM, price lists, warehouses, bank accounts, departments and cost centres.	Master-data validation and change controls pass.
3 - Inventory	Opening stock, FIFO, serial/batch tracking, transfers, quarantine, counts, loss and damaged goods.	Inventory subledger and G/L reconcile; negative stock tests pass.
4 - Purchasing and A/P	PO, Goods/Service Receipt, Three-Way Match, A/P Invoice, advances, returns, credit memos and supplier payments.	Source documents, supplier ledger and G/L reconcile.
5 - Sales and A/R	Price Lists, Sales Order, reservation, delivery, A/R Invoice, cash sales, receipts, credit limits, returns and warranty.	Stock, customer ledger, revenue and COGS reconcile.
6 - Money Transfer and Logistics	Client deposits, transfers, Client Inventory, Bank Execution Batch, returned transfers, logistics jobs, costs and margins.	Client balances, bank ledger, service margin and G/L reconcile.
7 - Projects, Contracting and Investments	Operational records, budgets, costs, billing, income, valuation and close.	Module subledgers and G/L reconcile.
8 - Finance and Treasury	Journal Entry, recurring journals, bank reconciliation, period close, year-end close and financial statements.	Trial Balance, subledgers and bank reconciliations pass.
9 - Fixed Assets, Budgeting, HR and Payroll	Asset lifecycle, depreciation, budgets, employees, payroll, expenses and advances.	Registers, payroll control and G/L reconcile.
10 - Reporting and Go-Live	Dashboards, reports, migration, UAT, training, parallel run, cut-over and hypercare.	Issa Mohammed signs business acceptance.

27.1 Delivery rule

For every release the IT specialist shall provide detailed configuration, data model changes, APIs, permissions, posting mappings, test results, known limitations and as-built documentation. No release is complete based only on screen availability.

28 Implementation Governance and Controlled Change

Approved business rules in this blueprint are implementation requirements. The development team shall not convert them into configurable alternatives unless the blueprint explicitly defines configuration.

28.1 Change control

- All functional, accounting, workflow, permission and report changes require written approval from Issa Mohammed.
- Every change shall record the current behaviour, required behaviour, affected modules, accounting impact, data impact, security impact, test cases and effective release.
- A change is not complete until documentation, automated tests, UAT evidence and training material are updated.

28.2 Clarification process

When a technical constraint or ambiguity is identified, the IT specialist shall document the issue and available technical options. Issa Mohammed selects and approves the final business treatment. The IT specialist shall not select a business or accounting outcome independently.

28.3 Future refinement

The initial ERP shall implement the standard accounting and operational policies defined in this blueprint. Gaps identified through testing and live operation shall be handled through controlled later releases without weakening audit history, reconciliation or source-document traceability.

Appendix A — Approved ERP Menu Tree

The following navigation tree is mandatory at functional level. Screen grouping can be refined for usability without removing required functions or changing permissions, statuses or posting behaviour.

Top-level menu	Required submenus / principal pages
1. Home	My Dashboard; My Tasks; My Approvals; Notifications; Recent Records; Global Search.
2. CRM	CRM Dashboard; Leads; Opportunities; Activities; Contacts; Business Partners; Pipeline; CRM Reports; Settings.
3. Sales	Sales Dashboard; Customer Price Lists; Sales Orders; Reservations; Pick Lists; Delivery Notes; A/R Invoices; Cash Sales; Customer Receipts; Credit Control; Sales Returns; Customer Credit Memos; Warranty Inquiry; Reports; Settings.
4. Purchasing	Procurement Dashboard; Purchase Orders; Goods Receipts; Service Receipt / Expense Confirmation; A/P Invoices; Supplier Advances; Supplier Payments; Goods Returns; Supplier Credit Memos; Match Exceptions; Reports; Settings.
5. Inventory & Warehouses	Availability; Opening Stock; Stock Movements; Transfer Requests; In-Transit; Quarantine; Returns; Damaged Goods; Serial/Batch Tracking; UOM; Stock Reconciliation; FIFO Valuation; Reports; Settings.
6. Projects & Contracting	Project Master; Contracts; WBS; Budgets; Change Orders; Project Costs; Procurement; Material Issues; Progress; Billing; Forecast; Close; Reports.
7. Logistics	Client Import Files; Logistics Jobs; Routes; Carriers; Shipping Documents; Client Charges; Direct Costs; Delivery Evidence; Claims; Settlement; Margin Reports.
8. Money Transfer	Client Accounts; Deposits; Transfer Instructions; Initiate Transfer; Bank Execution Batches; Fees; Returned Transfers; Refunds; Reconciliation; Client Statements; Margin Reports.
9. Investments	Investment Register; Transactions; Income; Valuation; Impairment; Maturity; Disposal; Reconciliation; Reports.
10. Finance - General Ledger	Journal Entry; Recurring Journals; Reversals; Exchange Rates; G/L Inquiry; Trial Balance; Soft Close; Year-End Close; Posting Mappings; Financial Statements.
11. Finance - Receivables	Customer Ledger; Open Items; Receipts; Allocations; Credit Limits; Collections; Statements; Ageing; Reconciliation.

Top-level menu	Required submenus / principal pages
12. Finance - Payables	Supplier Ledger; Open Items; Advances; Payments; Allocations; Statements; Ageing; Reconciliation.
13. Treasury & Banking	Bank and Cash Accounts; Receipts; Payments; Bank Transfers; Bank Statements; Reconciliation; Daily Position; Cash Forecast; Reports.
14. Fixed Assets	Asset Categories; Fixed Asset Documents; Asset Register; Available for Use; Depreciation; Transfers; Impairment; Disposal; Verification; Reports.
15. Budgeting	Budget Versions; Department and Project Budgets; Forecasts; Revisions; Commitments; Variance Reports.
16. HR, Payroll & Expenses	Employees; Organisation; Attendance; Leave; Payroll; Payslips; Employee Advances; Expense Claims; Travel; Asset Assignment; Reports.
17. Documents & Tasks	Document Centre; Templates; Checklists; Expiring Documents; Tasks; Notes; Retention; Audit.
18. Reports & Analytics	Executive; Financial; Sales; Purchase; Inventory; Projects; Logistics; Money Transfer; Investments; HR; Audit; Scheduled Reports.
19. Master Data	Chart of Accounts; Currencies and Rates; Branches; Departments; Cost Centres; Business Partners; Items; Supplier Item Codes; Barcodes; UOM; Price Lists; Warehouses; Banks; Payment Terms.
20. Administration	Company; Users; Department Manager Toggles; Roles; Permissions; Data Scopes; Numbering; Audit Trail; System Parameters; Background Jobs; Backup and Health.
21. Integrations & Support	API Clients; Imports; Bank Import; Interface Monitor; Error Queue; Release Notes; Data Quality; Change Requests; UAT Evidence; Support Runbooks.

Global user-interface rules

- Every list supports permission-controlled search, filters, sorting, saved views and export.
- Every record shows status, owner, branch, dates, source, approvals, related documents, journal entries and audit timeline.
- Only actions valid for the current status and permission are enabled.
- Draft documents are clearly marked and cannot be confused with final documents.

Appendix B — Transaction and Document Catalogue

This catalogue defines the minimum document objects, ownership, lifecycle and posting effect.

Document / object	Owner	Core statuses	Source / relationship	Effect
CRM Lead	CRM/Sales	Draft, Qualified, Disqualified, Converted, Closed	Contact / Business Partner	No posting
Opportunity	CRM/Sales	Open, Qualified, Won, Lost, Closed	Sales Order / Project	No posting
Sales Order	Sales	Draft, Pending Approval, Approved, Partially Delivered, Delivered, Closed, Cancelled	Business Partner / Price List	Stock reservation
Pick List	Warehouse	Draft, Released, Picked, Completed, Cancelled	Sales Order	Operational
Delivery Note	Warehouse/Sales	Draft, Approved, Delivered, Reversed	Sales Order	Inventory and COGS
A/R Invoice	Finance	Draft, Approved, Posted, Partially Paid, Paid, Reversed	Delivery Note	A/R and revenue
Customer Receipt / Cash Sale Receipt	Finance/Treasury	Draft, Approved, Posted, Allocated, Reversed	Customer / Invoice	Bank/cash and A/R
Sales Return	Warehouse/Sales	Requested, Received, Inspected, Accepted, Rejected, Closed	A/R Invoice / Delivery	Inventory movement
Customer Credit Memo	Finance	Draft, Approved, Posted, Allocated, Reversed	Sales Return / A/R Invoice	A/R and revenue reversal

Document / object	Owner	Core statuses	Source / relationship	Effect
Purchase Order	Purchasing	Draft, Pending Approval, Approved, Partially Received, Received, Closed, Cancelled	Supplier Business Partner	Commitment only
Goods Receipt	Warehouse	Draft, Pending Approval, Posted, Partially Returned, Returned	Purchase Order	Inventory and GRNI
Service Receipt / Expense Confirmation	Benefiting Department	Draft, Pending Approval, Approved, Reversed	Purchase Order	Receipt evidence / accrual
A/P Invoice	Finance	Draft, Matched, Exception, Pending Approval, Posted, Partially Paid, Paid, Reversed	PO and Receipt	A/P and cost
Supplier Advance	Finance/Treasury	Draft, Approved, Paid, Partially Settled, Settled, Refunded, Reversed	Purchase Order	Bank and supplier advance
Goods Return	Warehouse	Draft, Approved, Shipped, Posted, Closed	A/P Invoice / Goods Receipt	Inventory reversal
Supplier Credit Memo	Finance	Draft, Approved, Posted, Allocated, Reversed	Goods Return / A/P Invoice	A/P reversal
Warehouse Transfer	Warehouse	Requested, Approved, Issued, In Transit, Partially Received, Received, Investigating, Closed	Source and destination warehouse	Inventory movement
Stock Reconciliation	Warehouse	Planned, Counted, Recount, Pending Approval, Adjusted, Closed	Item/warehouse scope	Inventory adjustment
Damage Report / Write-Off	Warehouse	Draft, Approved, Transferred to Damaged, Written Off, Reversed	Inventory stock	Inventory loss
Client Deposit	Money Transfer	Draft, Posted, Available, Partially Used, Used, Refunded, Reversed	Client account / bank	Bank and client clearing
Money Transfer	Money Transfer	Draft, Funded, Initiated, Sent, Completed, Returned, Refunded, Reversed	Client deposits	Client clearing and bank
Bank Execution Batch	Treasury/Money Transfer	Draft, Approved, Executed, Reconciled, Reversed	Multiple source transactions	Bank execution/ reconciliation
Logistics Job	Logistics	Draft, Approved, In Progress, Delivered, Settled, Closed, Cancelled	Client Import File	Job cost and service revenue
Journal Entry	Finance	Draft, Pending Approval, Posted, Reversed	Manual or source module	General Ledger
Fixed Asset Document	Finance	Draft, Approved, Available for Use, Active, Disposed, Closed, Reversed	Purchasing evidence	Asset register and G/L

Appendix C — Approved Accounting Posting Matrix

Approved posting framework

The following matrix defines the required accounting event pattern. Exact account codes and account names are selected through Accounting Mapping after the Chart of Accounts is configured by Issa Mohammed. Every event shall produce a balanced IQD journal and retain branch, applicable dimensions, source document and historical-rate USD equivalent.

Business event	Debit	Credit	Control rule
Purchase Goods Receipt	Inventory	GRNI	PO and warehouse receipt required; FIFO layer created.
A/P Invoice - inventory	GRNI and approved variances	Supplier A/P	Three-Way Match required.
A/P Invoice - service/expense	Expense / Service Cost	Supplier A/P	PO and Service Receipt required.
Supplier advance payment	Supplier Advance	Bank/Cash	Linked to PO and settlement history.
Supplier payment	Supplier A/P	Bank/Cash	Allocated to approved open items.

Business event	Debit	Credit	Control rule
Goods Return	Return Clearing / Supplier position	Inventory	Quantity cannot exceed available return quantity.
Supplier Credit Memo	Supplier A/P	Return Clearing / Expense / Inventory variance	Linked to A/P Invoice and return.
Sales delivery and invoice	Customer A/R; COGS	Sales Revenue; Inventory	Same delivery and invoice date; Price List locked.
Customer receipt	Bank/Cash	Customer A/R	Allocation history retained.
Sales return and Credit Memo	Sales Returns; Inventory/Inspection	Customer A/R; COGS	Accepted return and source invoice required.
Warehouse transfer issue	Inventory in Transit	Source Warehouse Inventory	Destination receipt required to complete.
Warehouse transfer receipt	Destination Warehouse Inventory	Inventory in Transit	Actual received quantity.
Inventory loss	Inventory Loss Expense	Inventory / Inventory in Transit	Warehouse Manager approval.
Client money-transfer deposit	Bank	Client Clearing / Client A/P-Type Account	Multiple partial deposits allowed.
Money transfer execution	Client Clearing / Client A/P-Type Account	Bank	Locks transaction; reversal required for correction.
Money transfer bank fee	Bank Fees / Direct Transfer Expense	Bank	Linked to transfer.
Client-funded import payment	Client Inventory	Bank	No company warehouse quantity.
Client-funded goods delivery settlement	Client Account	Client Inventory	No Sales Invoice.
Logistics direct cost	Logistics Job Cost	Bank / Supplier A/P	Job link mandatory.
Logistics service recognition	Client Clearing / Client A/R	Logistics Revenue	Separate from Money Transfer margin.
Fixed asset recognition	Fixed Asset Cost	Supplier A/P / Bank / approved source	Fixed Asset Document.
Depreciation	Depreciation Expense	Accumulated Depreciation	Starts on Available for Use Date.
Manual Standard Journal	Configured account(s)	Configured account(s)	Finance only; one branch; full reversal only.
Year-end close	Revenue and/or Retained Earnings as applicable	Expenses and/or Retained Earnings as applicable	Creates new-year opening balances after reconciliation gate.

Posting engine control checklist

- Active Chart of Accounts validation.
- Balanced IQD entry.
- Historical exchange-rate and USD reporting value retained.
- Source document and line traceability.
- Branch and account-required dimensions validated.
- Duplicate posting prevented.
- Original and reversal linked permanently.
- Subledger-to-G/L reconciliation available.

Appendix D — Minimum Report and Dashboard Catalogue

Domain	Required report / dashboard	Key filters
Executive	Executive KPI Dashboard and Monthly Management Pack	Period, branch, department, cost centre, revenue stream, IQD/USD

Domain	Required report / dashboard	Key filters
Finance	Trial Balance; G/L Detail; Statement of Profit or Loss; Statement of Financial Position; Cash Flow; Changes in Equity	Period, account, branch, dimensions, IQD/USD
Finance Control	Journal Register; Reversal Register; Soft-Close Exceptions; Year-End Checklist; Subledger-to-G/L Reconciliation	Date, user, source, status, branch
A/R	Customer Statement; Ageing; Credit Exposure; Overdue Balance; Collections; Unapplied Receipts	Customer, salesperson, branch, currency, ageing bucket
A/P	Supplier Statement; Ageing; Advance Register; Payment Status; Three-Way Match Exceptions; Credit Memo Register	Supplier, branch, due date, PO, invoice
Treasury	Daily Bank and Cash Position; Bank Reconciliation; Bank Charges; Cash Forecast; Unreconciled Transactions	Bank, account, date, branch
CRM	Pipeline; Lead Conversion; Lost Opportunities; Customer Activity; Customer 360	Owner, stage, customer, business line
Sales	Sales Orders; Reservation; Delivery Backlog; Sales and Gross Margin; Price List; Discount Lines; Cash Sales; Returns; Warranty	Customer, item, warehouse, branch, date
Purchasing	Open Purchase Orders; Receipt Status; Spend Analysis; Supplier Price Variance; Match Exceptions; Supplier Performance	Supplier, item, buyer, branch, warehouse
Inventory	On Hand and Availability; FIFO Valuation; Serial/Batch Trace; In Transit; Quarantine; Damaged; Reconciliation Variance; Inventory Loss	Item, category, warehouse, branch, serial/batch
Projects	Budget vs Actual; Project Cost; Billing; Cash Position; Margin; Forecast to Complete	Project, WBS, customer, branch, cost centre
Logistics	Open Jobs; Direct Costs; Client Charges; Job Margin; Carrier Payables; Delivery Exceptions; Import File Status	Client, job, carrier, route, date
Money Transfer	Client Deposits; Open Client Balances; Transfer Register; Bank Execution Batch; Bank Fees; Gross Spread; Net Margin; Returned Transfers; Refunds	Client, bank, transfer, date, status
Investments	Investment Register; Income; Valuation; Impairment; Maturity; Disposal; Reconciliation	Investment type, counterparty, date
Fixed Assets	Asset Register; Available for Use; Depreciation; Net Book Value; Transfers; Impairment; Disposal	Category, branch, department, custodian
Budgeting	Budget vs Actual vs Forecast; Commitments; Variance; Cost Centre Performance	Version, period, department, project
HR/Payroll	Employee Register; Attendance; Leave; Payroll Register; Employee Advances; Expense Claims	Employee, department, branch, period
Audit	User Activity; Permission Changes; Approvals; Cancelled Drafts; Posted Reversals; Data Imports; Integration Errors	User, module, date, action

Report validation rules

- Every financial report drills to General Ledger and source document.
- Every operational report identifies posted and provisional data clearly.
- IQD and USD versions use the same source transactions; USD uses historical exchange rates.
- Totals reconcile across summary, detail, subledger and General Ledger reports.
- Export and scheduled delivery follow the same permissions as on-screen access.

Appendix E — Reference Basis, Glossary and Handover Templates

Reference basis

The company ERP Build Map and the approved decisions recorded by Issa Mohammed are the company-specific authority for this blueprint. Official IFRS and security references support the general accounting, presentation, inventory, revenue, fixed-asset, currency, control and technical framework. They do not authorise the implementation team to alter an approved company workflow.

Source	Reference	Use in this document
Company source	ERP System Build Map — Full Roadmap and Phase-by-Phase Requirements, July 2026.	Primary company-specific source provided for this blueprint.
Microsoft Learn	Record purchases with purchase invoices — Dynamics 365 Business Central.	Reference for receipt/invoice separation, partial processing and posted ledger traceability.
IFRS Foundation	IAS 2 Inventories.	Reference point for inventory accounting policy and consistent cost formula considerations.
IFRS Foundation	IAS 21 The Effects of Changes in Foreign Exchange Rates.	Reference point for foreign-currency transaction and exchange-rate policy considerations.
IFRS Foundation	IFRS 15 Revenue from Contracts with Customers — supporting material.	Reference point for product/service/project revenue-recognition policy design.
FATF	Guidance for a Risk-Based Approach for Money or Value Transfer Services.	Reference for risk-based AML/CFT controls in transfer-service requirements.
NIST	Cybersecurity Framework 2.0.	Reference for cybersecurity risk-management structure and operational governance.
OWASP	Application Security Verification Standard (ASVS).	Reference for application security requirements and verification.
OWASP	Logging Cheat Sheet and Broken Access Control guidance.	Reference for security event logging and server-side deny-by-default access control.
COSO	Internal Control — Integrated Framework guidance.	Reference for principles-based internal control design and monitoring.

Key glossary

Term	Meaning
A/P	Accounts Payable — amounts owed to suppliers and related vendor subledger.
A/R	Accounts Receivable — amounts due from customers and related customer subledger.
BRD	Business Requirements Document.
Control account	G/L account whose balance is supported by a detailed subledger and is normally protected from direct manual posting.
Dimension	Analytical classification such as department, project, warehouse, branch, cost centre or profit centre applied to transactions.
Document date	Commercial/source-document date; distinct from posting, due, value and system dates.
G/L	General Ledger — the central accounting ledger.
GRNI	Goods Received Not Invoiced — clearing/accrual between receipt and supplier invoice.
Idempotency	A control ensuring repeated submission of the same business event does not create duplicate effects.
KYC	Know Your Customer — identity and due-diligence information required by approved policy/law.
MVTS	Money or Value Transfer Services.
Posting	Committing an approved business event to subledger and/or G/L entries.
Posting profile	Configuration that determines accounts and dimensions for a business event.
RBAC	Role-Based Access Control.
RPO	Recovery Point Objective — maximum acceptable data loss measured in time.
RTO	Recovery Time Objective — maximum acceptable service restoration time.
Subledger	Detailed ledger for customers, vendors, inventory, assets, banks, projects or client funds that reconciles to a G/L control account.
Three-way match	Comparison of purchase order, receipt and supplier invoice before posting/payment.
UAT	User Acceptance Testing performed by business users against approved requirements.
WBS	Work Breakdown Structure used to organise project scope, budget, cost and progress.

Detailed requirement template for each screen/process

Specification field	What the implementation team must document
Requirement ID	Unique, stable identifier linked to release, module and test case.
Business objective	Problem solved, value and process owner.
Actors and permissions	Who creates, views, edits, submits, approves, executes, posts, reverses, exports and administers.
Preconditions	Required master data, prior documents, balances, period status and attachments.
Screen/fields	Field name, type, length/precision, mandatory rule, default, source, allowed values, editability and help text.
Workflow/status	Allowed transitions, actor, approval role, timers, rejection/recall/delegation and lock behaviour.
Validations	Field, cross-field, duplicate, limit, credit/budget/stock, currency, date and compliance rules.
Calculations	Formula, rounding, currency, quantity/UOM, tax/charge, cost and total logic.
Accounting event	Trigger, debit/credit rules, control accounts, dimensions, FX and reversal.
Inventory/operational event	Quantity/value movement, reservations, in-transit, project/logistics impact.
Integrations	Inbound/outbound data, API/file/event, ownership, idempotency and error handling.
Attachments/evidence	Required document types, checklist, version, retention and confidentiality.

Specification field	What the implementation team must document
Notifications	Event, recipient, channel, escalation and suppression.
Reports/audit	Reports affected, drill-down, audit events and control reconciliation.
Exceptions	Partial processing, over/under tolerance, cancellation, return, correction, failure and recovery.
Acceptance criteria	Given/when/then scenarios, expected balances/statuses, security and performance evidence.
Out of scope	Explicitly excluded behaviour to prevent assumption.

RACI template

Deliverable / decision	Issa Mohammed	Department Manager	IT Specialist	Users / Testers
Business process, accounting logic, workflow and scope	A/R	C	C	I
Department operational requirements	A	R/C	C	C
Solution architecture and technical implementation	A for business outcome	I	R	C
Permissions and approval configuration	A	C	R	I
Build and technical tests	I	I	A/R	C
UAT and business reconciliation	A	R	C	R
Migration and go-live approval	A/R	C	R	C

Legend: R = Responsible, A = Accountable, C = Consulted, I = Informed.

Change request template

Field	Required content
Change ID and title	Unique ID and clear description.
Requested by / date	Business owner and request date.
Reason and benefit	Regulatory, control, operational, defect or improvement rationale.
Current and required process	What changes in workflow, data, accounting, reports and user experience.
Impact assessment	Modules, interfaces, migration, security, data, training, timeline and cost.
Accounting/control review	Posting, reconciliation, approval and audit consequences.
Decision	Approve, reject, defer or request more analysis; approver and date.
Implementation evidence	Requirements, code/release, test cases, UAT, documentation and training.

Final Handover Note

This blueprint converts the company's current roadmap into an integrated business and functional design for an expanded ERP. It is intended to guide discovery, detailed specification, solution architecture, development, testing and acceptance. It shall not be treated as permission for the implementation team to invent accounting, tax, legal, payroll, compliance or approval policies that the company has not approved.

Definition of "done"

A module is complete only when the business workflow works end to end; permissions and approvals are enforced server-side; source documents, subledgers and G/L reconcile; cancellation/reversal is controlled; reports drill to evidence; audit logging is complete; tests pass; users are trained; and the process owner signs acceptance.

This document shall remain under version control as the governing ERP blueprint. Approved changes must update both the requirements and the related tests so that the system and its documentation remain aligned throughout implementation and future expansion.
